Today I just happen to be home and a gardener/landscaper nearby was using a leaf powered gas blower and I was wondering why the smell of the gasoline and the exhaust was coming into my house? Do you realize my central air conditioner is outside along with the fan in the can which is a plumbing term that blows air into my house via the boiler room. Surprise surprise now I know why many people die of carbon monoxide poisoning because the landscaper or the gardener is using all these gas powered/petrol powered machines around everybody's house and then disappears and low and behold a few hours later because none of the windows are open people inside the house succumb to carbon monoxide poisoning!

I therefore recommend you permanently ban all gasoline powered machinery that these people use for gardening purposes throughout the year , instead of just until a few months expiring September 30.
Guess what? I have lots of carbon monoxide detectors and they don't pick up the scent of the gasoline until it is too late. This is a definite no-no to gas/petrol powered leaf blower's etc.

In conclusion ,
carbon monoxide poisoning is happening silently and slaw poisoning all the homeowners who have a fan
in the can with their air conditioners and boiler room to blow air into the house which blows in the
carbon monoxide from these gas/petrol powered machinery.

Please keep in mind carbon monoxide detectors don't work until the smell it's so powerful that it
overwhelms and kills.

Please

please ,

thanks

Best wishes.
